

IN THE CLAIMS

Please amend the claims as follows:

1. (Currently Amended) An apparatus for providing direct signaling for switching and control of transmissions in an integrated optical network, said apparatus comprising:

5 a plurality of electrical signaling interfaces for receiving requests from external signaling networks;

a processing module for processing said requests from said external signaling networks; and

10 at least one optical signaling interface for coupling to optical components in said integrated optical network, said optical signaling interface being operable to transmit processed requests from said processing module for assignment of optical channels for said optical components;

15 wherein signaling processed by said processing module from said external signaling networks is provided directly to the optical network components via said optical signaling interface and ~~said processing module operates in cooperation with said electrical and optical signaling interfaces to provide signaling in said integrated optical network that~~ is independent of legacy signaling methodologies employed by ones of said external signaling networks.

2. (Original) The apparatus of Claim 1, wherein said external signaling networks are selected from the group consisting of circuit switched signaling networks,

packet switched signaling networks, SS7, H323, SIP and other enhanced signaling system (ESS) apparatus.

3. (Original) The apparatus of Claim 1, wherein said optical components are selected from the group consisting of optical cross connects, optical add/drop multiplexers and optical service nodes including at least one optical cross connect and optical add/drop multiplexer.

4. (Original) The apparatus of Claim 1, wherein said processing module is a signaling and call control processor.

5. (Original) The apparatus of Claim 4, further including a signaling and endpoint applications module coupled to said processor module for providing electronic and optical routing decisions.

6. (Original) The apparatus of Claim 5, further including a network management and provisioning module for providing network management interaction for reporting of alarms and receiving commands for provisioning and reconfiguration of said apparatus.

7. (Original) The apparatus of Claim 6, further including a system administration module for providing an operator interface for administration and maintenance of said system.

8. (Original) The apparatus of Claim 1, wherein said optical signaling interface couples to said optical components through an optical user network interface.

9. (Original) The apparatus of Claim 8, wherein said apparatus is further operable to control signaling of electrical switching devices that couple to said apparatus through an optical service node.

10. (Original) The apparatus of Claim 1, wherein said apparatus is operable to assign individual wavelengths in said optical components in accordance with requests from said external signaling networks and allocate calls to existing wavelengths.

11. (Currently Amended) An apparatus for providing ~~directly~~ switching fabric independent allocation of transport resources in an integrated optical network, said apparatus comprising:

a plurality of electrical signaling interfaces for receiving requests from external
5 signaling networks;

a signaling and call control module for processing said requests from said external signaling networks;

a signaling and endpoint applications module coupled to said signaling and call control module for providing electronic and optical routing decisions;

10 a network management and provisioning module for providing network management interaction for reporting of alarms and receiving commands for provisioning and reconfiguration of said apparatus; and

at least one optical signaling network interface for coupling to optical components in said integrated optical network, said optical signaling interface being

15 operable to transmit processed requests from said signaling and control module for assignment of optical channels for said optical components;

wherein signaling processed by said signaling and call control module from the external signaling networks is provided directly to the optical network components via said optical signaling network interface and ~~said signaling and call control module~~
 20 ~~operates in cooperation with said signaling and endpoint applications module and with said electrical and optical signaling interfaces to provide signaling in said integrated optical network that~~ is independent of legacy signaling methodologies employed by ones of said external signaling networks.

12. (Original) The apparatus of Claim 11, wherein said apparatus is further operable to control signaling of electrical switching devices that couple to said apparatus through an optical service node.

13. (Original) The apparatus of Claim 11, wherein said apparatus is operable to assign individual wavelengths in said optical components in accordance with requests from said external signaling networks and allocate calls to existing wavelengths.

14. (Original) The apparatus of Claim 11, wherein said external signaling networks are selected from the group consisting of circuit switched signaling networks, packet switched signaling networks, SS7, H323, SIP and other enhanced signaling system (ESS) apparatus.

15. (Original) The apparatus of Claim 11, wherein said optical components are selected from the group consisting of optical cross connects, optical add/drop multiplexers and optical service nodes including at least one optical cross connect and optical add/drop multiplexer.

16. (Currently Amended) A method for providing direct signaling for switching and control of transmissions in an integrated optical network, said method comprising:

receiving requests from external signaling networks at an electrical signaling
5 interface;

processing said requests from said external signaling networks; and

transmitting processed requests from said processing module via an optical signaling interface that couples to optical components in said integrated optical network for assignment of optical channels for said optical components;

10 wherein said processing step operates to process signaling requests from the external signaling networks for provision directly to the optical network components via said optical signaling network interface, the processed signaling being ~~operates in cooperation with said receiving and said transmitting steps to provide signaling in said integrated optical network that is independent of legacy signaling methodologies~~
15 employed by ones of said external signaling networks.

17. (Original) The method of Claim 16, wherein said external signaling networks are selected from the group consisting of circuit switched signaling networks,

packet switched signaling networks, SS7, H323, SIP and other enhanced signaling system (ESS) apparatus.

18. (Original) The method of Claim 16, wherein said optical components are selected from the group consisting of optical cross connects, optical add/drop multiplexers and optical service nodes including at least one optical cross connect and optical add/drop multiplexer.

19. (Currently Amended) A system for providing direct signaling for switching and control of transmissions in an integrated optical network, said system comprising:

a signaling apparatus including,

5 a plurality of electrical signaling interfaces for receiving requests from external signaling networks;

a processing module for processing said requests from said external signaling networks; and

10 at least one optical signaling interface for coupling to optical components in said integrated optical network, said optical signaling interface being operable to transmit processed requests from said processing module for assignment of optical channels for said optical components;

~~wherein said processing module operates in cooperation with said electrical and optical signaling interfaces to provide signaling in said integrated optical network that~~
15 ~~is independent of signaling methodologies employed by ones of said external signaling networks;~~

an optical service node including,

at least one optical cross connect (OXC); and

at least one optical add/drop multiplexer (OADM), said OADM

20 including electrical interfaces to circuit switched and packet switched fabrics,

said OXC and OADM each including at least one interface to an optical network

or other optical components,

said optical service node coupling to said signaling apparatus through ~~an~~ said
optical ~~user~~ signaling interface wherein signaling processed by said processing module

25 from the external signaling networks is provided directly to the optical network

components via said optical signaling interface and is independent of legacy signaling

methodologies employed by ones of said external signaling networks.
